EXAM OPERATIONS PROTOTYPE

Student Room Finder

One browser tab that finds a student's seat, keeps the roster, and tells every invigilator exactly where to be.

VERIFIED SEATING

Bosscoder · Exam Operations

October 2026

THE PROBLEM

01

Exam day still runs on paper and memory

Scattered rosters

Student lists live across spreadsheets, PDFs, and whatever the last organizer remembers.

Hand-built seating

Room and seat numbers get recalculated by hand for every single exam date.

Invigilators in the dark

Staff often learn their room assignment the same morning, from someone else.

Lines at the gate

Students queue to ask one question: which room, which seat.

WHAT IT DOES

Six tools, one tab

Student lookup

Find any student's room and seat by roll number or name, instantly.

Roster management

Add, edit, bulk-import, and export the full roster as CSV.

Automatic seating

Rooms fill by lowest occupancy first, inside the capacity you set.

Exam scheduling

Publish date, subject, timing, and instructions students can look up.

Duty allocation

Assign invigilators to rooms, auto or by hand, with a staffing minimum.

Admin mode

A passcode-gated view keeps staff tools separate from student access.

HOW SEATING WORKS

Lowest occupancy, filled first

Room 1
Fills first

→

Room 2
Fills once Room 1 catches up

→

Room 3
Takes the overflow

Default rule: the room with the lowest current occupancy gets the next student — never past its set capacity.

Every published exam also gets its own rotated seat order, so the same students aren't always neighbors twice.

WHO SEES WHAT

Three views, one dataset

STUDENT

Access: open, no login needed

- Look up their own room and seat by roll number
- View exam date, timing, and instructions
- See building, floor, and directions to their room

INVIGILATOR

Access: name lookup

- Check their assigned room and duty by full name
- See the standard duty checklist for their role
- No edit access to rosters or schedules

UNIVERSITY STAFF

Access: demo passcode

- Manage the full roster and import/export CSV
- Publish exam schedules and allocate duties
- Set room locations and data retention rules

UNDER THE HOOD

No build step. No backend. No install.

The whole app is one HTML file. Open it in a browser and it runs — nothing to deploy, nothing to configure.

FRONTEND
Vanilla HTML / CSS / JS
Zero dependencies, zero build step

PERSISTENCE
Browser localStorage
No server required for the prototype

HOSTING
Single static file
Email it, host it, or open it locally

STYLING
Inline CSS, light/dark aware
Consistent look, no stylesheet to ship

WHAT TO WATCH

Honest about the edges

⚠ **Demo-only passcode.** The staff passcode lives in the page's own JavaScript and is checked entirely in the browser — it is not real access control.

⚠ **No cross-device sync.** Data lives in one browser's local storage. Nothing shares across devices or users.

⚠ **Unverified student login.** Email sign-in checks the format only, never real identity.

⚠ **Local-only retention.** The auto-delete timer only runs while the page happens to be open.

WHAT'S NEXT

From prototype to platform

NOW

Browser prototype

Roster, seating, scheduling, and duty allocation, all running client-side.

→

NEXT

A real backend

A database and API so records persist and sync across every device.

→

LATER

Institutional rollout

University SSO, audit-logged admin actions, and verified student identity.

Built to solve exam day. Designed to grow beyond it.
